

Transformation Profile

How to migrate derivative copy creation configuration to use the new transformation profile.

In V 4.0 we've migrated all the OOTB stream handler to migration plugins.

1. Create a transformation profile using a migration plugin parallel to the stream handler (e.g. tiff2jpg)

2. Open the create derive copy task parameters that used the stream handler
3. Change the parameters to use a transformation profile, and select the appropriate transformation profile from the combo-box.
