Aleph Installation Kit

Version 20 and Later

This guide is for Linux and Solaris servers. For AIX, refer to the document: Aleph 20 Installation Instructions - AIX.
CONFIDENTIAL INFORMATION

The information herein is the property of Ex Libris Ltd. or its affiliates and any misuse or abuse will result in economic loss. DO NOT COPY UNLESS YOU HAVE BEEN GIVEN SPECIFIC WRITTEN AUTHORIZATION FROM EX LIBRIS LTD.

This document is provided for limited and restricted purposes in accordance with a binding contract with Ex Libris Ltd. or an affiliate. The information herein includes trade secrets and is confidential.

DISCLAIMER

The information in this document will be subject to periodic change and updating. Please confirm that you have the most current documentation. There are no warranties of any kind, express or implied, provided in this documentation, other than those expressly agreed upon in the applicable Ex Libris contract. This information is provided AS IS. Unless otherwise agreed, Ex Libris shall not be liable for any damages for use of this document, including, without limitation, consequential, punitive, indirect or direct damages.

Any references in this document to third-party material (including third-party Web sites) are provided for convenience only and do not in any manner serve as an endorsement of that third-party material or those Web sites. The third-party materials are not part of the materials for this Ex Libris product and Ex Libris has no liability for such materials.

TRADEMARKS

"Ex Libris," the Ex Libris bridge, Primo, Aleph, Alephino, Voyager, SFX, MetaLib, Verde, DigiTool, Preservation, URM, Voyager, ENCompass, Endeavor eZConnect, WebVoyage, Citation Server, LinkFinder and LinkFinder Plus, and other marks are trademarks or registered trademarks of Ex Libris Ltd. or its affiliates.

The absence of a name or logo in this list does not constitute a waiver of any and all intellectual property rights that Ex Libris Ltd. or its affiliates have established in any of its products, features, or service names or logos.

Trademarks of various third-party products, which may include the following, are referenced in this documentation. Ex Libris does not claim any rights in these trademarks. Use of these marks does not imply endorsement by Ex Libris of these third-party products, or endorsement by these third parties of Ex Libris products.

Oracle is a registered trademark of Oracle Corporation.

UNIX is a registered trademark in the United States and other countries, licensed exclusively through X/Open Company Ltd.

Microsoft, the Microsoft logo, MS, MS-DOS, Microsoft PowerPoint, Visual Basic, Visual C++, Win32,

Microsoft Windows, the Windows logo, Microsoft Notepad, Microsoft Windows Explorer, Microsoft Internet Explorer, and Windows NT are registered trademarks and ActiveX is a trademark of the Microsoft Corporation in the United States and/or other countries.

Unicode and the Unicode logo are registered trademarks of Unicode, Inc.

Introduction

Ex Libris provides an automated Aleph Installation Kit (AIK) for customer self-installation. The installation should be performed by a local System Administrator. The installation can take up to a few hours, depending on the server.

**NOTE:**
To ensure that your server is suitable for Aleph v.20, fill out and e-mail a copy of the *Aleph ARC Sizing Request Form* to SizingManager@exlibris.com. Ex Libris has created a sizing calculator that allows you to do this calculation for your site on your own.

These documents are posted in the Upgrade Express part of the Documentation Center. Certification of your server hardware is a necessary step before installing the new version.

If you are purchasing new hardware for Aleph, you must receive confirmation of your proposed configuration prior to ordering it. Do not use the sizing calculator in this case. Instead, contact your sales representative, who will work with you and with the Ex Libris Sizing Manager to make sure the hardware and operating system you order are adequate to run the new release. If you have any questions at all about the capability of your hardware configuration, your sales representative can help you get definitive answers about it.

**NOTES:**
- If you plan to install Oracle or create the Oracle database without using the Aleph Installation Kit, you must coordinate this in advance with Ex Libris by sending an SI to Aleph Support. Refer to the document *Database Installation Requirements for RAC and Single Database* for details on how to perform this type of installation.
- Ex Libris offers installation services at a cost to interested customers. Contact your local office to obtain a price.
This document provides instructions for the automatic installation of Aleph 20 using the Aleph Installation Kit (AIK). The package facilitates installation of Aleph 20, Oracle 11g, and the creation of an Oracle database.

The AIK includes the following components:

- Installation package - scripts and init files
- Aleph software - Aleph application and pre-generated third-party products (Java, Perl, Apache, and so on)
- Oracle RDBMS v.11.1 Enterprise edition
- Oracle database for Oracle RDBMS v.11.1

The Aleph installation using AIK involves the following steps:

- Download software from FTP server
- Pre-installation tasks
- Oracle database installation and configuration
- Third-party product installation
- Aleph software installation and configuration
- Post-installation tasks

**NOTE:**

During the Aleph installation, two reboots of the server are required: one for new values of the system parameters to take effect and the other to test startup scripts. Other Ex Libris applications on the server that use Oracle experience a short downtime as well when the new Oracle 11g listener is configured. The downtimes occur during Step 3 of the Oracle installation and configuration. For more information, see Step 3: Oracle Database Installation and Configuration on page 19.
Pre-Installation Information

This section includes:
- Overview on page 7
- Preparing for Installation on page 8
- Downloading the AIK from the FTP Server on page 9
- Configuring Oracle SGA Size on page 10

Overview

The AIK can be downloaded from the Ex Libris FTP server or, in special circumstances, supplied as a DVD package for customers with strict security policies.

Customers should open a support incident (SI) in order to:
- Obtain the Aleph Installation Kit (AIK) and license
- Order an installation based on a contract
- Order an installation as a professional service

See Appendix E: How to Obtain a New Aleph Installation on page 41 for more information.

The Aleph installation is performed in the following standard directories:
- Aleph software under the directory /exlibris/aleph/a20_<slot>
- Oracle software under the directory /exlibris/app/oracle/product/11

A single log file containing confirmation and feedback on the installation, the status of each step, and reporting errors is created. This log file is placed under: /exlibris/ftp_from_exlibris/aik/log/aleph_installation_kit.log
Supported Topologies

The Aleph Installation Kit supports the following two kinds of Aleph topologies:

- All-in-one installation – both application and database are installed at the same server
- TWO-TASK mode – application and database installed on separate servers.
  For more information, see Appendix F: Two-Task Installation on page 43.

Coordinate the installation of any other kind of topology with the local support office and installation team.

Preparing for Installation

Before the AIK can be installed, the server must meet specific requirements and contain a download directory for the installation files.

Creating the ftp_from_exlibris Directory

If you are installing a fresh copy of Aleph 20.01 on a server that does not have an earlier version of Aleph, perform the following steps to create the ftp_from_exlibris directory:

1. Log on to the server as root.
2. Enter the following commands to create the ftp directory:

```bash
    cd /exlibris
    mkdir ftp_from_exlibris
```

Checking System Requirements

Before installing Aleph, verify that all operating system components comply with the Aleph requirements, as outlined in Requirements for Aleph Installation.

Check and update the /etc/hosts file as follows, if required:

```bash
    vi /etc/hosts
```

Figure 1 shows an example of a /etc/hosts file. When configuring the file:

- The first active line should be configured exactly as shown.
- The second line should contain the internal IP address followed by the fully qualified name (host name + domain name), and then the short name and possible aliases.
Chapter 2: Pre-Installation Information

Figure 1: Example of /etc/hosts File

The internal IP address can be found using the following commands.

- For Sun:

```bash
/usr/sbin/ifconfig -a | grep inet | grep -v 127.0.0.1 | awk '{print $2}'
```

- For Linux:

```bash
/sbin/ifconfig -a | grep addr: | grep -v 127.0.0.1 | awk '{print $2}'
```

**IMPORTANT:**
Any changes in the /etc/hosts file should be performed by a qualified System Administrator only.

## Downloading the AIK from the FTP Server

To download the installation package from the Ex Libris FTP server, execute the following commands from your server:

```bash
cd /exlibris/ftp_from_exlibris
ftp ftp.exlibrisgroup.com [<username>:aik ; <password>]
ftp prompt> cd scripts
ftp prompt> bin
ftp prompt> get aik.20.<date>.tar
ftp prompt> quit
```

Enter the following command to extract the AIK package:

```bash
tar -xvf aik.2.02.tar
cd aik
./ikit_menu
```
Configuring Oracle SGA Size

To increase the performance of the Oracle database, adjust the Oracle SGA size for the created database. For more information, see Appendix G: Oracle SGA Sizing on page 45.
Aleph Installation

This section includes:
- Introduction on page 11
- Step 1: Download Software from FTP Server on page 12
- Step 2: Pre-Installation Tasks on page 14
- Step 3: Oracle Database Installation and Configuration on page 19
- Step 4: Third-Party Product Installation on page 22
- Step 5: Aleph Software Installation and Configuration on page 24
- Step 6: Post-Installation Tasks on page 26

Introduction

Perform all AIK steps in the order displayed in the AIK main menu - that is, first complete the functions under Step 1 in the order listed. When those functions are completed, proceed to Step 2, and so forth.

NOTE:
Steps that should be performed by the root or oracle user have a corresponding note. All other steps should be performed as the aleph user.

You can exit the AIK at any stage of the installation. To restart the process, enter the following commands:

```
cd /exlibris/ftp_from_exlibris/aik
./ikit_menu
```

A single log file, containing confirmation and feedback on the installation, the status of each step, and reporting errors can be found under:

`/exlibris/ftp_from_exlibris/aik/log/aleph_installation_kit.log`
The AIK Main Menu

The AIK main menu (see Figure 1) is used throughout the Aleph installation, outlining the main steps of the installation. The main menu has a header that includes the current date and operating system used. The Aleph directory and the Oracle database fields are populated once the relevant components are installed.

Step 1: Download Software from FTP Server

The first step in the main menu is to download the software from the FTP site. Enter 1 to display the Download software from FTP server menu (see Figure 2).

NOTE:
Root access is required to perform the download tasks.
Aleh Installation Kit

Date: Sun Feb 04 14:56:47 IST 2007
OS: Linux
Aleph version: 20.00
Aleph directory:
Oracle database:

1. Download software from FTP server
   - 1. Download Aleph software
   - 2. Download Oracle software
   - 3. Check if the Aleph software was downloaded correctly
   - 4. Check if Oracle software was downloaded correctly

Enter key (q to quit)[q]:

---

**Download Aleph Software**

This utility uses the `wget` client for downloading Aleph software from the Ex Libris FTP server.

An e-mail message is sent to the address you specify when the FTP download completes.

Enter 1 to download the Aleph software. The system prompts for the following:

- **target download directory name** — The default is `/exlibris/ftp_from_exlibris`.
- Press `Y` to use passive FTP.
- **e-mail address** for the download confirmation message — Enter your e-mail address.

**NOTE:**

Ex Libris recommends using the suggested defaults wherever possible to avoid changes.

---

**Download Oracle Software**

This utility uses the `wget` client for downloading the Oracle software from the Ex Libris FTP server.

An e-mail is sent to the specified address when the FTP download is complete.
Enter 2 to download the Oracle software. The system prompts for the following:
- target download directory name — The default is /exlibris/ftp_from_exlibris.
- e-mail address for the download confirmation message — Enter your e-mail address. The default is the e-mail address you entered in the previous step.

Check if Aleph Software Was Downloaded Correctly

This utility checks whether or not the Aleph software was downloaded correctly. When complete, an e-mail is sent to the specified address.

This step prompts for the following information:
- target download directory name — The default directory is /exlibris/ftp_from_exlibris.
- e-mail address for the download confirmation message — The default is the e-mail address entered previously (see Download Aleph Software on page 13).

Check if Oracle Software Was Downloaded Correctly

This utility checks to see whether or not the Oracle software was downloaded correctly. When complete, an e-mail is sent to the specified address.

This step prompts for:
- target download directory name — The default directory is /exlibris/ftp_from_exlibris.
- e-mail address for the download confirmation message — The default is the e-mail address entered previously (see Download Aleph Software on page 13).

If you encounter a problem with the download and cannot resolve it, contact your local support office.

Step 2: Pre-Installation Tasks

This menu (see Figure 3) contains the tasks that must be entered before installation.

NOTE:
Root access is required to perform the pre-installation tasks.
Pre-Installation Checks
This step checks whether the server meets the specifications required for Aleph version 20.0 installation.

Inserting Listener Definition to the /etc/services File as root User
This step inserts the following string into the /etc/services file, if required:

| listener | 1521/tcp | # Oracle listener |

Change System Parameters as root User
This step checks the system parameters in the system configuration file.
Open a new session on your server as the root user and check that the system variables in the configuration file include the parameters below:

NOTE:
The following system parameters are a required minimum. They can be changed later according to the size of the DB on the server.
Linux Servers — Using any text editor, create or edit the `/etc/sysctl.conf` file, and add or edit lines similar to the following. Include lines only for the kernel parameter values that you want to change. For the semaphore parameters (kernel.sem), you must specify all four values. However, if any of the current values are larger than the minimum value, then specify the larger value:

```plaintext
fs.file-max = 65536
kernel.shmall = 2097152
kernel.shmmmax = 2147483648
kernel.shmmax = 4096
kernel.sem = 250 32000 100 128
net.ipv4.ip_local_port_range = 9000 65500
net.core.rmem_default = 262144
net.core.rmem_max = 4194304
net.core.wmem_default = 262144
net.core.wmem_max = 1048576
```

Enter the following command to change the current values of the kernel parameters:

```bash
# /sbin/sysctl -p
```

Sun Solaris 8 and 9 — The following system parameters should be present in the `/etc/system` file:

```plaintext
set shmsys:shminfo_shmmax = 4294967295
set shmsys:shminfo_shmmn = 1
set shmsys:shminfo_shmseg = 10
set shmsys:shminfo_shmmni = 100
set semsys:seminfo_semmns = 1530
set semsys:seminfo_semmsl = 400
set semsys:seminfo_sempem = 100
set semsys:seminfo_semmx = 32767
set semsys:seminfo_semvmx = 140
set rlim_fd_max = 4096
set rlim_fd_cur = 1024
```

Sun Solaris 10 – Add the following parameters:

- `projadd group.dba`
- `projmod -s -K "project.max-shm-memory=(privileged,10GB,deny)" group.dba`

Create Oracle User and DBA Group as root User

This step creates the `dba` group and Oracle 11g `oracle` user with the user home set to `/exlibris/app/oracle/product/11` and user shell set to `/bin/csh`. 
The new oracle user must contain only alphanumeric characters, and use only lower-case alphabetic characters. When creating the new user for Oracle 11g, the utility prompts for a new UNIX password.

If the Oracle 10g/9i/8 oracle user already exits in the system, the utility prompts for the name of the Oracle 11g user. Give the new Oracle 11g user a different name than the Oracle 10g/9i/8 user (such as oracle11).

**NOTE:**
The new Oracle11g user is created with the same UID as the existing Oracle 10g/9i/8 user.

---

### Create aleph User and exlibris Group as root User

This step creates the exlibris group and the aleph user with the user home set to /exlibris/aleph and the user shell set to /bin/csh.

If the aleph user already exists, make sure its home directory is set to /exlibris/aleph by running the following command:

```
echo ~aleph
```

If the home directory for this user is not /exlibris/aleph, delete the user and then re-run this step to recreate it with the correct definitions.

### Create Aleph and Oracle Directories in the Disk /exlibris as root User

This step prompts you for the following:

- The installation type. Select **SW_ONLY** if the database already exists or will be installed on a remote server. Select **DB_ONLY** when Aleph 20 SW exists or will be installed on a remote server. If you select **ALL** or **DB_ONLY**, you are also prompted for database datafile locations.
- The database disk location for archiving [ /exlibris ]
- The database disk location for redo files [ /exlibris ]
- The database disk location for data files [ /exlibris ]
  
  For example:
- The database disk location for archiving [ /exlibris ] /exlibris1
- The database disk location for redo files [ /exlibris ] /exlibris2
- The database disk location for data files [ /exlibris ] /exlibris1
NOTE:
Directories for DB installation can be installed on three different mount points.

This step creates the following directories:

<table>
<thead>
<tr>
<th>Directory</th>
<th>Permissions</th>
</tr>
</thead>
<tbody>
<tr>
<td>/exlibris1/oradata</td>
<td>oracle:dba permissions</td>
</tr>
<tr>
<td>/exlibris2/oradata</td>
<td>oracle:dba permissions</td>
</tr>
<tr>
<td>/exlibris1/oradata</td>
<td>oracle:dba permissions</td>
</tr>
<tr>
<td>/exlibris/app/oracle/product</td>
<td>oracle:dba permissions</td>
</tr>
<tr>
<td>/exlibris/aleph</td>
<td>aleph:exlibris permissions</td>
</tr>
<tr>
<td>/exlibris/aleph/ora_aleph</td>
<td>aleph:exlibris permissions</td>
</tr>
<tr>
<td>/exlibris/aleph/backup_temp</td>
<td>aleph:exlibris permissions</td>
</tr>
<tr>
<td>/exlibris/tmp</td>
<td>aleph:exlibris permissions</td>
</tr>
<tr>
<td>/exlibris/startup</td>
<td>aleph:exlibris permissions</td>
</tr>
<tr>
<td>/exlibris/product</td>
<td>aleph:exlibris permissions</td>
</tr>
</tbody>
</table>

Install COBOL Software as root User

This step prompts you to enter the location for the third-party product distribution package (default is /exlibris/ftp_from_exlibris).

- Linux Servers — COBOL Server Express 5.0 is installed.
- SUN Servers — COBOL Server Express 2.2 is installed.

If Cobol 4.0.0 is already installed on the server, you are prompted to confirm the upgrade. Upgrading is highly recommended but not mandatory.

If another applications installed on the server is using Cobol 4.0.0, you need to link that application to the new Cobol version. For instructions, see Appendix D: Relink Other Products/Copies to New Cobol on page 39.

Create System Auto Startup/Shutdown Script and Links as root User

This step creates the main startup/shutdown script in /etc/init.d/exlibris, if required.

Required links for automatic startup and shutdown of Aleph and the database (when rebooting) are also created.
NOTE:
If the startup mechanism already exists, AIK only updates files in the /exlibris/startup directory and checks if relevant files and links in the system directories exist.

Step 3: Oracle Database Installation and Configuration

NOTE:
You must run step **Extract Oracle Software as root User** on page 19 as the root user. All later steps can use either the oracle11 user or the root user.

---

**Aleph Installation Kit**

---

Date: Sun Feb 04 14:57:50 IST 2007
OS: Linux
Aleph version: 20.01
Aleph directory:
Oracle database:

---

3. Oracle database installation and configuration

- 1. Extract Oracle software
- 2. Create listener.ora and tnsnames.ora file
* 3. Install database
- 4. Check connection to the database via listener
* 5. Create Oracle start/stop scripts(only on Dedicated Oracle Server)

Enter key (q to quit)[q]:

---

**Figure 4: Oracle Database Installation and Configuration Menu**

**Extract Oracle Software as root User**

This step prompts you to enter the location of the Oracle 11g software distribution package files (default is /exlibris/ftp_from_exlibris).

This step extracts the Oracle software to the following directory:

/exlibris/app/oracle/product/11
Install Database

This step prompts you to enter the following parameters:

- location of the database installation script files — The default is /exlibris/ftp_from_exlibris.
- location of the database media files — The default is /exlibris/ftp_from_exlibris.
- name of the database you want to install — The default is meta4.
- confirmation of the DB files distribution:
  - location of the database archive files [default is /exlibris]
  - location of the database system files [default is /exlibris]
  - location of the database data files [default is /exlibris]

Figure 5 is an example screen shot:

![Install database](image)

Create listener.ora and tnsnames.ora Files

This step adds the created database definitions to the listener.ora and tnsnames.ora files.

If this is a remote DB, you are prompted for the following:

Enter the Oracle host [<FQDN>]
Enter the Oracle SID [aleph20]

Start Up Oracle Listener

This step starts up the Oracle 11g listener.
Chapter 3: Aleph Installation

If the Oracle 9i/10g listener is already running (for example, if other Ex Libris applications are running on this server), instructions for shutting down the running listener are provided.

**NOTE:**
Shutting down the Oracle 9i/10g listener in order to start up the Oracle 11g listener, results in a short downtime for all applications on this server that are running Oracle.

The following procedure should be used if there is a listener already running:

1. Log on to the server as the running listener user and type:
   ```
   lsnrctl stop
   ```

The AIK menu takes you through the next steps:

2. Do not close the existing window. Open a new terminal window. In the second window, perform a shutdown of the other Ex Libris applications on the server that are using currently running listener (using a standard shutdown procedure for each application).

3. In this additional terminal window, shut down the currently running Oracle listener using UTIL O/2 or standard utility for listener shutdown (as oracle, `lsnrctl stop`).

4. In the first terminal window, re-run this procedure.

5. In the additional terminal window, start up the other Ex Libris applications on this server that were shut down (using the standard startup procedure for each application).

**NOTE:**
Once Oracle 11g is started, all applications running Oracle on this server will operate on the new Oracle 11g listener.

**Check Connection to the Database Via Listener**

This step checks the connection to the created database via the listener.

**NOTE:**
Listener status is available after at least two minutes have passed since the previous step was executed.

**Create Oracle Start/Stop Scripts (Only on Dedicated Oracle Server)**

Creating start/stop scripts should only be done on the Oracle server.
Increase Tablespace Size for Customer Databases

The Aleph Installation Kit provides databases with minimal tablespace sizes. Some of these tablespaces should be increased for normal Aleph functionality. The following table contains the recommended sizes for TEMP and UNDO tablespaces:

<table>
<thead>
<tr>
<th>DB Size</th>
<th>Tablespace Size</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>UNDO</td>
</tr>
<tr>
<td>DEMO</td>
<td>500MB</td>
</tr>
<tr>
<td>SMALL</td>
<td>1GB</td>
</tr>
<tr>
<td>LARGE</td>
<td>2GB</td>
</tr>
</tbody>
</table>

Increase the tablespace size with the Aleph UTIL O/13/2 utility. For more information on UTIL O, refer to the Aleph System Administration Guide.

Step 4: Third-Party Product Installation

Extract Binary Product Package

The utility installs all relevant third-party products under the /exlibris/product directory.

It first prompts you to enter the location of the third-party product distribution package files. The default location is /exlibris/ftp_from_exlibris.
Installing /exlibris/product directory

Please enter the location of the Aleph software media files [/exlibris/ftp_from_exlibris] :

Installing /exlibris/product ... please wait ...

The binary product package was extracted to the /exlibris/product

Press any key to continue
Step 5: Aleph Software Installation and Configuration

For a completely new installation of Aleph, you must run the first step (Extract Aleph software) as user root.

If the Aleph installation exists on the same server, this step can be performed as user aleph.

The rest of the steps can be performed as user aleph or continued as user root.

Extract Aleph Base

This step has two phases:

- The first prompts you to enter the:
  - location of Aleph software files [default is /exlibris/ftp_from_exlibris]
  - copy number of Aleph installation [default 1]

- The second phase prompts for selecting cataloging formats. You can choose from the following [mab, uni, usm] or no default. At least one must be chosen. When installing more than one format, enter each one in a different line (with ENTER between formats). See the following example:
Figure 9: Extract Aleph Base

Selecting all three is also acceptable.

**IMPORTANT:**
The first format entered is the main format of the installation.

### Aleph Software Configuration

This step prompts you to enter:
- The server WWW server name (FQDN)
- The Oracle server short hostname
- Additional languages to install (fre/ger) and if it should be the main language

### Update License

This step asks the installer to update the Aleph 20 license files using the UNIX vi text editor.

The license files are located at:
- `/exlibris/aleph/a20_<slot>/alephe/tab/license`
- `/exlibris/aleph/a20_<slot>/alephe/tab/license.www_x`

**IMPORTANT:**
This is a mandatory step. If it fails, do not continue with the installation.

### Install Service Pack

This step installs the Aleph 20 Service Pack (if applicable). It prompts you to enter the location of the Aleph Service Pack distribution package files. The default is `/exlibris/ftp_from_exlibris`.

A failure message may be displayed during SP installation if the installed version is equal or higher than the SP package. This is not actually an installation failure.
For example:

```
Error: Your Service Pack level is 2261. sp.utility not found. Exiting.
Error: failed to install the service pack
```

**Relocate alephe Directory**

This step:
- deletes unnecessary language files
- deletes unused DB users, according to the selected formats
- relocates the alephe directory and creates the u tree

**Update Auto Startup/Shutdown Script**

This step creates the startup scripts and the `init.dat` file under the `/exlibris/startup` directory.

**Step 6: Post-Installation Tasks**

This menu contains the post-installation tasks (see Figure 10).

```
Aleph Installation Kit
---------------------------------------------------------------------
Date: Sun Feb 04 15:00:21 IST 2007
OS: Linux
Aleph version: 20.01
Aleph directory:
Oracle database:
---------------------------------------------------------------------
6. Post-installation tasks
   - 1. Update aleph user login menu
   - 2. Run test compilation
   - 3. Add table spaces util
   - 4. Startup Aleph software

Enter key (q to quit)[q]:
```

Figure 10: Post-Installation Tasks
Update aleph User Logon Menu

This step adds the newly installed Aleph software to the aleph user login menu. The files /exlibris/aleph/def_aleph.dat and /exlibris/aleph/def_version are updated.

Run Test Compilation

This step checks if the installed Aleph software is configured correctly and is ready for future Aleph 20 Service Pack installations.

Add Tablespace Util

To add the tablespace utility:

1. In order to add data files to the new Aleph 20 database, you need to get a list of data files and sizes from the previous Aleph version. Get the list of data files by using the sdbdesc.sh util or util 01 4 8 as described in Appendix C: Create Source Database Files List and Sizes on page 37.

2. If the /exlibris/ftp_from_exlibris/sdbdesc/tmp/src_ts_list.list file exists, the system uses it automatically; otherwise, enter the mount points for the database files at the prompt, for example: /exlibris,/exlibris1.

   If you have a remote database, enter the mount points and available space for each.

3. Enter the first mount point name than press ENTER. Enter the second mount point name and press ENTER and so on. To quit press q.

   **NOTE:** Make sure that for every mount point entered there is there is a /oradata/<ORACLE_SID> directory.

4. Select one of the following tablespaces: TS1D, TS2D, TS3D, or TS4D.

5. For each tablespace enter the size in GB. Only whole numbers are valid. For each tablespace, the system automatically generates an Index table one third the size of the tablespace (1GB minimum).

   The system prints the data and generates an SQL file with proper commands.

   **NOTE:** You can view or change the SQL under ./log file name: CreateAddDataFiles.sql.
The system executes the command in the background and sends an e-mail notification when completed.

**Startup Aleph Software**

This step starts Apache and the Aleph 20 software.
Appendixes

This guide contains the following appendixes:

- **Appendix A**: Manual Database Creation on page 31
- **Appendix B**: Import Demo Libs on page 35
- **Appendix C**: Create Source Database Files List and Sizes on page 37
- **Appendix D**: Relink Other Products/Copies to New Cobol on page 39
- **Appendix E**: How to Obtain a New Aleph Installation on page 41
- **Appendix F**: Two-Task Installation on page 43
Manual Database Creation

To manually create a database:

1. Log on as an Oracle 11 user and extract the create db scripts:

```
cd /exlibris/ftp_from_exlibris
.tar xzvf install_ora.tar.gz
.cd oracle/11
```

2. Execute the install db script and follow the instructions:

```
oracle11@il-inst03(aleph20)oracle/11$csh -f
pre_db_creation.csh

Enter some parameters ...
Oracle SID: aleph20
Server short Host Name (without domain name): [il-inst03] il-inst03
Host's Domain [corp.exlibrisgroup.com]: corp.exlibrisgroup.com
Set environment parameter ORACLE_BASE to determine the location of DB creation scripts and logs
Enter ORACLE_BASE path or default to [/exlibris/app/oracle]: /exlibris/app/oracle
ORACLE_HOME is set to /exlibris/app/oracle/product/11
Is this correct?
If not, correct the environment of oracle11 before you continue
Continue ? [y]: y
```

3. Enter the data files locations.
4. Insert each disk. For each disk you insert, make sure that it has `oradata` directory with `oracle:dba` permissions.

Enter Disk 1 Name or Enter to end of list [/exlibris]: /exlibris
Enter Disk 2 Name or Enter to end of list: /exlibris2
Enter Disk 3 Name or Enter to end of list:

Enter Exlibris Product
1 - ALEPH <- default  
2 - METALIB  
3 - DIGITOOL  
4 - VERDE  
5 - ARC  
6 - PRIMO  
7 - DPS  
8 - URM

</tbody>
</table>
To increase the performance of the Oracle database, adjust the Oracle SGA size for the created database. For more information, see Appendix G: Oracle SGA Sizing on page 45.

Now database creation is running in the background. After database installation completes successfully, continue with Appendix B: Import Demo Libs on page 35.
Import Demo Libs

NOTES:

- **VIR01** is normally a DEMO library. If the DEMO libraries import is done on a server where customer data has already been loaded and is in use, shut down Aleph (or at least the pc_server and www_servers) while the importing is running in order to avoid conflicts in the use of the vir01 tables.

- If your **usr_library** or **pw_library** in **aleph_start** is set to **USR00**, this process deletes your patron and password data. (It is our strong recommendation that the **USR00** not be used as your **usr_library** or **pw_library**).

Perform the following steps after the Aleph software is installed and configured:

1. **Download the aleph20 dump file from the FTP:**

   ```
   cd /exlibris/ftp_from_exlibris
   wget "ftp://ver20:password@ftp.exlibris.co.il/dpdump/*"
   cat aleph20_demo.dmp.gz_* | gzip -dc > aleph20_demo.dmp
   aleph20_demo.dmp
   ```

2. **Create the dumpdir directory and run the import:**

   ```
   sqlplus ALEPH_DBA/ALEPH_DBA as sysdba
   CREATE or replace DIRECTORY dumpdir AS '/exlibris/ftp_from_exlibris';
   GRANT READ,WRITE ON DIRECTORY dumpdir TO ALEPH_ADMIN;
   exit
   
   DLIBS=`echo $DEMO_LIBS | sed 's/ /,/g'`
   set DD=`date +%y%m%d`
   impdp $ALEPH_ADMIN schemas=$DLIBS DIRECTORY=dumpdir
   DUMPFILE=aleph20_demo_libs.dmp LOGFILE=aleph20_libs.$DD.log
   >& /dev/null
   ```
Create Source Database Files List and Sizes

To create a list of files and sizes, use `sdbdesc.sh` or `Util O 14 8` in the source Aleph copy.

Create a file to describe the database files and sizes.

**To create the file:**

1. Log on to the Source DB server as aleph user:
   
   ```
   cd /exlibris/ftp_from_exlibris
   ```

   **NOTE:**
   Make sure that the aleph user has write permissions.

2. Download the DB description util:
   
   ```
   wget -c "ftp://ver20:M0zart20@ftp.exlibris.co.il/scripts/sdbdesc.sh"
   ```

3. Execute the util:
   
   ```
   sh sdbdesc.sh
   ```

   When the util is successfully completed, a file is created under `/exlibris/ftp_from_exlibris/sdbdesc/tmp/src_ts_list.list`

   This output file describe the source database files and the sizes that are required when adding files to the new Aleph 20 database.

   If the source server and target server are different, copy the file to a specific folder on the target server (the location of the `aik` directory):
To copy the file to a specific folder:

1. Create a folder on the target server:

   ```
   mkdir -p sdbdesc/tmp
   ```

2. Create the `src_ts_list.list` file however you want. (for example, `scp`, `cut&paste`). The DB files creation step requires this file.
Relink Other Products/Copies to New Cobol

If there are other copies or applications installed on the server that use cobol_4.0.0, re-link the Cobol to the new Cobol software that comes with the kit.

For example, when Aleph 20 is installed in parallel with Aleph 19.01, do the following:

1. Log on to Aleph 19.01.
2. Go to the local product:

   ```
   cd $aleph_product/local
   rm cobol
   ln -s /exlibris/product/cobol5 cobol
   ```
How to Obtain a New Aleph Installation

To obtain a new Aleph installation, log on to Pivotal and open a support incident.

Figure 11: How to Obtain a New Aleph Installation
Fill in the form according to the following table:

Table 3. How to Obtain a New Aleph Installation

<table>
<thead>
<tr>
<th>Field</th>

<td>■ Enter the IP of the server where you are going to install Aleph 20.</td>
</tr>
</tbody>
</table>

If you have chosen as the subject **Ex Libris installation according to contract** or **We request that Ex Libris install Aleph as a paid service**, add to the SI the following documents, as appropriate:

- **Request for Aleph Installation Form**
- **03_Aleph ARC Sizing Request Form**
- **04_Automated_Server_Sizing_Check_For_Upgrade_Compatibility**
Two-Task Installation

To configure two-task installation mode:

1. On the DB server, install the Oracle Client and the Aleph database. For information on how to do this, see Step 3: Oracle Database Installation and Configuration on page 19.

2. On the application server, run a full installation, but skip the install database and startup Oracle listener steps.

3. Insert the Oracle host name (database server name) in Step 5: Aleph Software Installation and Configuration. For more information, see Step 5: Aleph Software Installation and Configuration on page 24.
Oracle SGA Sizing

Introduction

By default, the database is created with an SGA size of 700MB (the memory in Oracle Shared Global Area for this database). To increase Oracle performance, increase this value.

According to Oracle directives, the cumulative amount of SGA sizes for all running databases on the server should be less than server RAM / 3. So, according to SGA sizes defined for all the present databases, as well as the server RAM, you can increase the DB SGA.

Checking the SGA Size

To check the SGA size:

1. Log on as the oracle user.
2. Enter the following commands to check the SGA size for database <DB_NAME>. In the following example, the SGA size for the connected database is 700 MB:

   ```
   idle> show parameter memory
   **** Hit return to continue ****
   NAME TYPE VALUE
   -------------------------- ------------- --------------------
   memory_max_target big integer  700M
   memory_target big integer  700M
   ```
Increasing the SGA Size

CAUTION:
Oracle SGA resizing should be performed by an Oracle expert only. When performing an upgrade, we recommend referencing the parameters of the DB used in a previous version (the version to be upgraded).

1. To increase SGA size to 2000 MB (for example) for database `<DB_NAME>` for Oracle 11, type the following, as the `oracle` user:

```
> setenv ORACLE_SID `<DB_NAME>`
> sqlplus /nolog idle> connect /as sysdba
idle> alter system set MEMORY_MAX_TARGET=2000M SCOPE=spfile;
idle> alter system set MEMORY_TARGET=2000M SCOPE=spfile;
```

2. Restart the database by entering the following commands:

```
idle> shutdown immediate
idle> startup
```

Solving an SGA Parameter Error

On Solaris 10, since a classic system parameter change in the `/etc/system` file has no effect, you may encounter problems when increasing the SGA size after a DB restart:

```
ORA-27102: out of memory
SVR4 Error: 22: Invalid argument
```

In this case, change the relevant OS memory parameter as the root user and run the following:

```
# projmod -s -K "project.max-shm-memory=(privileged, 10GB,deny)" group.dba
```

If a problem occurs while setting this SGA parameter, define the appropriate Solaris project for Oracle by running the following commands as the root user:

```
# projadd group.dba
# projmod -s -K "project.max-shm-memory=(privileged, 10GB,deny)" group.dba
```

When this has been completed, restart the database.
