Search Online Catalog or Database

• **Product:** New RefWorks

**Question**

What is the Search Databases in new RefWorks?

**Answer**

The database search is a basic search process that uses the Z39.50 protocol. This protocol returns limited search results from publicly available databases or library catalogs that can be accessed from within RefWorks. Commercial and subscription databases are no longer included in this list.

This search can produce different results than one performed from the catalog or database native interface.
